

RISK ANALYSIS OF AI USE BY STUDENTS IN PROJECT PSE

Wieteke de Kogel

AGENDA

Explanation of AI-Risk Assessment Protocol (AI-RAP)

Break

Assignment using the protocol

Evaluation assignment

PURPOSE

The use of AI is becoming increasingly common

Special attention is needed for young people still in their learning process

Awareness about the risks of AI usage by students for academic tasks:

- AI related risks
- Student's competence and behaviour risks
- Impact on learning outcomes

AI-Risk Assessment Protocol (AI-RAP) – compare FMEA in engineering

PROTOCOL IN SHORT

1. Task definition

2. AI risk assessment

- A. AI operational risk – $\text{Likelihood}_{\text{AI}}$
- B. Student's competence and behaviour risk - $\text{Likelihood}_{\text{Student}}$
- C. Impact on learning process – Impact

The risk for each dimension is determined by several key risk factors

3. Overall risk calculation

- Each key factor within a dimension can be scored with a value
- Risk Assessment Number (RAN) = $(\text{Likelihood}_{\text{AI}} + \text{Likelihood}_{\text{Student}}) * \text{Impact}$

4. Risk mitigation by verification

- SIFT+ method

1. TASK DEFINITION

The task needs to be described as specific as possible

You do not need to give the whole prompt, but describe the deliverable you want AI to give you

NO: “Analyze data”

YES: “Analyze experimental data from a tensile test to generate a stress strain curve”

NO: “Write code”

YES: “Write a piece of code with Python to calculate stress for given material”

NO: “Search literature”

YES: “Search scientific literature about...”

2. AI RISK ASSESSMENT

The 3 dimensions that determine the risk to use AI

- A. AI operational risk – tool related
- B. Student's competence and behaviour risk – user related
- C. Impact on learning process – context related

The risk for each dimension is determined by several key risk factors

OVERVIEW DIMENSIONS/KEY FACTORS

A. AI OPERATIONAL RISK

- AI – GenAI – LLM
 - If AI used in these slides we talk about LLM
 - UT - CoPilot
- Probabilistic model
- Hallucinations – nonsensical or inaccurate outputs

A. AI OPERATIONAL RISK

- AI – GenAI – LLM
- Probabilistic model
- Hallucinations

An example output from an LLM. These probabilities add up to 1 (or 100%)

<https://www.swiftask.ai/blog/what-is-an-llm>

A. AI OPERATIONAL RISK

Key risk factors causing hallucinations:

- Frequency and accessibility of patterns that AI is trained on
- Conflicting information in the AI training set
- Outdated, incomplete or false information in the AI training set
- Bias in AI algorithms

A. AI OPERATIONAL RISK

“Frequency and accessibility of patterns that AI is trained on”

A. AI OPERATIONAL RISK

“Conflicting information in the AI training set”

Gemini

Give me the definition of process time in manufacturing.

In manufacturing, **process time** is the amount of time a product or work item spent being "worked on" at a specific workstation or during a specific stage of production.

While often confused with *cycle time*, process time is a more granular metric used to analyze the efficiency of individual tasks rather than the entire production line.

Key Characteristics

- **Granular Focus:** It measures the interval required for a product to progress through one specific development stage (e.g., just the "welding" stage or just the "painting" stage).
- **Includes Non-Value Time:** Technically, process time includes both the time spent physically changing the product (value-added) and any unavoidable internal delays at that specific station.
- **The "Red Dot" Principle:** A common way to measure it is to mark a single unit and time it from the moment it enters a workstation to the moment it leaves that specific station.

manufac

ChatGPT

Give me the definition of process time in manufacturing.

Process time in manufacturing is the amount of time during which a product is actively being worked on to transform it from one state to another.

It includes only the time when value is being added, such as:

- Machining
- Assembly
- Welding
- Painting
- Any operation where labor or equipment is directly processing the product

Process time **excludes** setup time, waiting time, transportation, storage, and inspection.

In simple terms, process time is the "hands-on" or "machine-on" time required to perform a specific manufacturing operation.

Give me the definition of process time in manufacturing.

Copilot

In manufacturing, **process time** is a well-defined term used in operations management and lean manufacturing.

Process Time — Definition

Process time is the amount of time during which a product, part, or material is actively being worked on by a machine or an operator.

It represents the **value-adding time** in the production process.

Key characteristics

- Only includes the time when actual transformation occurs (cutting, welding, machining, assembling, etc.).
- **Does NOT include** waiting, transportation, inspections (unless transformative), or downtime.
- Considered part of the **value-added time** in lean terminology.

Example

If machining a component takes 45 seconds of cutting and shaping, and no other direct action happens during that period, the **process time = 45 seconds**.

Relationship to other time concepts

- **Cycle time** = total time to complete one unit (may include waiting or delays).
- **Lead time** = total time from order to delivery.
- **Processing time (process time)** = value-adding work only.

A. AI OPERATIONAL RISK

“Outdated, incomplete or false information in the AI training set”

CoPilot is trained till April 2023, but constantly accesses internet through Bing

Eye disease Bixomania – Almira Osmanovic Thunström

Two fake studies published as pre-prints full of hints that they are fake

ChatGPT, Gemini, Copilot all presented Bixomania as real illness

Out of control: fake article citation in a Springer magazine

AI-generated images of bixonimania, a fictitious illness. Source: Preprints.org <https://doi.org/qzm4> (2024).

A. AI OPERATIONAL RISK

“Outdated, incomplete or false information in the AI training set”

CoPilot is trained till April 2023, but constantly accesses internet through Bing

But also, if you as a user ask AI to analyse non-verified data:

A. AI OPERATIONAL RISK

“Bias in AI algorithms”

AI tends to choose answers that seem m

Example stereotyping bias: nurse & doctor

CoPilot

ChatGPT

Afbeelding gemaakt • Vriendelijke zorg in de hal

Gemini

Afbeelding gemaakt • Dokter in ziekenhuisgang met clipboard

A. AI OPERATIONAL RISK

To conclude:

Every time you ask AI to perform a task think about the abilities of AI and try to estimate the risk on hallucinations

The AI-RAP tool includes examples and descriptions of tasks to help you to estimate the risk level:

AI operational risk			Student's competence/behavior	
Key risk factor	Description/guidance	Probability of risk occurring (Likelihood _{AI})	Key risk factor	Description/guidance
Frequency & accessibility of patterns	Unlikely: Task uses common concepts that are easy to verify.	☐ Unlikely (1)		Unlikely: You can craft clear, simple prompts; ambiguity is rare.
	Possible: Task involves applied or moderately specialized concepts requiring some interpretation.	☒ Possible (2)	Example Possible (Summarize lecture notes on thermodynamics) Reasoning: Thermodynamics is moderately specialized. AI has seen similar patterns but may misinterpret context or equations. This requires some interpretation, so there is a possible risk.	
	Likely: Task covers highly specialized or advanced topics with rare patterns, where AI often struggles.	☐ Likely (3)		produce misleading outputs, and you cannot re them.

B. STUDENT'S COMPETENCE AND BEHAVIOUR RISK

Key risk factors:

- AI prompting skills
- Evaluation AI output
 - Domain Knowledge
 - Fact checking skills
- Cognition and behaviour

B. STUDENT'S COMPETENCE AND BEHAVIOUR RISK

Explain this typical English saying: "If everyone counts, you can count on each other."

Copilot ⓘ

The saying "If everyone counts, you can count on each other" plays on the two meanings of the word *count*:

1. "Everyone counts"

This means **everyone matters**, everyone is valued, and each person is included and respected. It emphasizes equality, belonging, and the idea that every individual's contribution is important.

2. "You can count on each other"

Here, *count on* means **rely on** or **trust**. If people feel valued, they are more willing to support one another.

• "Is this a typical English saying: "..."?"

Putting it together

The saying means:

In a group where every person is treated as important, people will naturally trust and support each other.

In other words:

When everyone feels seen and respected, cooperation and mutual reliability become possible.

If you'd like, I can also give examples of contexts where this saying is used—such as team culture, teaching, or community building.

Is this a typical English saying: "If everyone counts, you can count on each other."?

Copilot ⓘ

Short answer: **No.**

Based on available information, "If everyone counts, you can count on each other" is *not* a typical or established English saying or proverb.

Why?

- It does **not** appear in collections of common English proverbs such as lists of the *most common English proverbs*. [youtube](#)
- It also does **not** show up among widely quoted teamwork sayings in curated collections of teamwork quotes. [atlassian](#)
- It does **not** match any traditional proverb structure described in references defining what constitutes a proverb or saying. [wikipedia](#)

What is it, then?

It sounds like a **modern motivational slogan** or an organizational/team-building phrase. It uses wordplay ("count" meaning *matter* vs. *rely on*), which is common in contemporary corporate or educational messaging, but it isn't a traditional proverb.

If you'd like, I can help rewrite it, make it sound more idiomatic, or find a similar *actual* English proverb.

Bronnen [📺](#) [📌](#) [📄](#) [📎](#) >

B. STUDENT'S COMPETENCE AND BEHAVIOUR RISK

“Domain knowledge”

“Fact checking skills”

“You can only recognize mistakes if you have the right knowledge to do so”

B. STUDENT'S COMPETENCE AND BEHAVIOUR

“Cognition and behaviour”

Over trust in AI authority and cognitive bias

The **Dunning–Kruger effect** is a cognitive bias that describes the systematic tendency of people with low ability in a specific area to give overly positive assessments of this ability.

Diederik Jekel, Dutch science journalist

B. STUDENT'S COMPETENCE AND BEHAVIOUR RISK

To conclude:

Be honest about your own capabilities. This tool is not about judging how good you are, this tool is about creating awareness and to help you use AI responsibly.

The AI-RAP tool includes examples and descriptions of tasks to help you to estimate the risk level:

Domain knowledge (evaluation AI output)	Unlikely: Strong domain knowledge; errors are easily spotted. Knowledge gained in previous course and passed with sufficient grade.	☐ Unlikely (1)	Minor: Using AI is fully allowed under course rules.
	Possible: Some domain knowledge present but not (yet) well established; minor conceptual errors may be overlooked. Verification requires effort (e.g. checking a formula in a textbook).	☒ Possible (2)	Example Possible (Student learned topic before but struggles with details, or is studying topic now, needs AI to explain again) Reasoning: Moderate knowledge allows partial verification but minor conceptual errors may go unnoticed, so there is a possible risk.
	Likely: Limited domain knowledge; major errors go unnoticed. Lower-level students (1 st -year bachelor).	☐ Likely (3)	Minor: Task involves basic thinking (e.g. recall).

C. IMPACT ON LEARNING PROCESS

Key risk factors:

Essential knowledge and skills (learning objectives of a course)

- Alignment with learning objectives and future learning
- Ethical and academic integrity – what is allowed?

Personal development

- Critical thinking
- Dependency risk

C. IMPACT ON LEARNING PROCESS

“Essential knowledge and skills”

Take care you know what goals need to be achieved for a course (Canvas/Osiris)

It is not only about getting a sufficient grade, but also about getting the right knowledge and skills to be a proper engineer

Using AI to replace tasks related to a learning goal introduces a risk

202000237 - Academic Res. Skills ME/SET/CEM/CME ▾

GENERAL AIMS CONTENT INSTRUCTIONAL MODES & TESTS MATERIALS

After the course has been completed the student is able to:

- Review and evaluate scientific literature in order to identify gaps and frame a research topic.
- Plan and design scientific research in order to formulate a feasible and justified research proposal.
- Analyse and interpret scientific research results in order to draw well-supported conclusions.
- Write and argue scientifically in order to produce coherent academic text.
- The student is able to demonstrate academic professionalism and integrity in order to work responsibly within academic standards.
- The student is able to orally present and discuss scientific research in order to communicate findings effectively.

ARS LEARNING GOALS

The student is able to (**systematically*) review and evaluate scientific literature in order to identify gaps and frame a research topic. **CS/IST only*

The student is able to plan and design scientific research in order to formulate a feasible and justified research proposal.

The student is able to analyse and interpret scientific research results in order to draw well-supported conclusions.

The student is able to write and argue scientifically in order to produce coherent academic text.

The student is able to demonstrate academic professionalism and integrity in order to work responsibly within academic standards.

The student is able to orally present and discuss scientific research in order to communicate findings effectively.

E.g.: Don't ask AI to write your text, but ask AI for feedback.

C. IMPACT ON LEARNING PROCESS

“Critical thinking” – personal development

These course goals do not only contribute to knowledge about a topic or skills to solve similar problems but also train you to think critically; one of the most important skills for an (academic) engineer

“The quantitative analysis revealed significant differences in cognitive performance between high and low AI-user groups. ... Figure 1 shows a negative correlation ($r = -0.42$, $p < 0.01$) between AI usage intensity and critical thinking scores across disciplines, with humanities students exhibiting the steepest decline.” (Rohilla, 2025)

Figure 1: AI Usage Hours vs. Critical Thinking Performance

C. IMPACT ON LEARNING PROCESS

“Dependency risk” – personal development

Cognitive laziness

Principle of the least effort:

“It postulates that animals, people, and even well-designed machines will naturally choose the path of least resistance or “effort”.” (Wikipedia)

Elephant path Zwolle
Gain: 8.9 meters

C. IMPACT ON LEARNING PROCESS

“Dependency risk”

“Educational institutions should integrate AI tools into standard academic practice”

“Together, the results suggest that AI tools may encourage students to become “lazy thinkers”, potentially reducing their cognitive engagement when relying heavily on tools like ChatGPT.”
(Georgiou, 2025)

Figure 1: Scores (Likert-point scale from 1–5) of the experimental and control groups in the CES-AI.

Georgiou, G. P. (2025). *ChatGPT produces more “lazy” thinkers: Evidence of cognitive engagement decline* (No. arXiv:2507.00181). arXiv. <https://doi.org/10.48550/arXiv.2507.00181>

C. IMPACT ON LEARNING PROCESS

To conclude:

Take care you check the learning objectives of a course (Canvas/Osiris). Remember you are here to learn, to develop yourself to an academic engineer. And again: this tool is not about judging your behaviour, this tool is about creating awareness and to help you use AI responsibly.

The AI-RAP tool includes examples and descriptions of tasks to help you to estimate the risk level:

Impact on learning process		
Key risk factor	Description/guidance	Severity of consequences (Impact)
Alignment with learning objectives & future learning (essential knowledge & skills)	Minor: Task applies basic theories, equations, tools etc. and reinforces foundational knowledge. Not part of learning objective course. Task requires minimal practice; skipping has little impact on fluency.	☐ Minor (1)
	Moderate: Task builds on core concepts for applied or moderately advanced projects, contributing to deeper understanding but not critical for mastery (partially learning objectives). Task benefits from some repetition to build confidence and speed, but gaps are manageable.	☒ Moderate (2)
	Major: Task is essential for mastery or heavily weighted in grading/exams (core learning objective of course); skipping it creates knowledge gaps. Task needs repeated practice for fluency (e.g. calculations, coding, diagrams); skipping blocks automaticity and speed under pressure.	☐ Major (3)

Examples

Moderate (Student asks AI for quick definitions instead of recalling them)
Reasoning: Definitions are part of foundational knowledge. Using AI reduces retrieval practice, weakening memory but not entirely blocking learning, so impact is moderate.

Moderate (Student uses AI to simplify theory whenever unclear)
Reasoning: Student avoids productive struggle, reducing conceptual development. Some skill practice is lost, so impact is moderate.

3. OVERALL RISK CALCULATION

Risk Assessment Number (RAN)

$$RAN = (Likelihood_{AI} + Likelihood_{Student}) * Impact$$

Likelihoods and Impact are the averages of the scores given per key risk factor per dimension

The tool calculates the RAN automatically

If the RAN is moderate or even critical verification of the AI output is necessary to mitigate the risk of using it for a specific task

AI operational risk		
Key risk factor	Description/guidance	Probability of risk occurring (Likelihood _{AI})
Frequency & accessibility of patterns	Unlikely: Task uses common concepts that are easy to verify.	☐ Unlikely (1)
	Possible: Task involves applied or moderately specialized concepts requiring some interpretation.	☒ Possible (2)
	Likely: Task covers highly specialized or advanced topics with rare patterns, where AI often struggles.	☐ Likely (3)

		Impact				Likelihood _{total}
		1 - <1,5	1,5 - <2	2 - <2,5	2,5 - ≤3	
2 - <3	2 - <4,5	3 - <6	4 - <7,5	5 - ≤9		
3 - <4	3 - <6	4,5 - <8	6 - <10	7,5 - ≤12		
4 - <5	4 - <7,5	6 - <10	8 - <12,5	10 - ≤15		
5 - ≤6	5 - <9	7,5 - <12	10 - <15	12,5 - ≤18		

Low
Moderate
Critical

4. RISK MITIGATION BY VERIFICATION

Verification necessary depends on RAN value

RAN range	Risk level	Verification action
2 - <4	Low	Quick self-check. Verify obvious facts (definitions, units) using a textbook or lecture notes. No external tools needed.
4 - <8	Moderate	Apply the <i>SIFT+</i> method for AI output verification and responsible AI use in learning.
≥8	Critical	Question yourself whether you want to take the risk to use AI for this task. If you decide to proceed verification is very important, but might not be completely possible. Apply the <i>SIFT+</i> for AI output verification and responsible AI use in learning. Always include human oversight and maintain clear traceability throughout the process.
If any value = 3		Apply one or more additional actions of the <i>SIFT+</i> method. If one key factor of C (Impact on learning process) = 3; consider not to delegate core task to AI.

Link website about lateral reading and SIFT:

<https://libguides.mnsu.edu/sourcecredibility/lateralreading>

4. RISK MITIGATION BY VERIFICATION

SIFT+ by Mike Cauldfield + additions for student's competence and behaviour and impact on learning process

1. **Stop** (RAN check)

- + e.g. “AI-after-me” rule, usage limit

2. **Investigate** the source

3. **Find** better coverage (lateral reading)

- + e.g. re-prompt in different words, human checkpoint

4. **Trace** claims to original context

- + e.g. dependency guard, step-by-step reasoning

Extensive explanation of SIFT+ method can be found in AI-RAP tool itself

5. THE TOOL; AI-RAP

AI operational risk				Student's competence/behaviour risk				Impact on learning process															
Task where to use AI or Key risk factor	Description/guidance	Probability of risk occurring (Likelihood _{AI})	Key risk factor	Description/guidance	Probability of risk occurring (Likelihood _{Student})	Key risk factor	Description/guidance	Severity of consequences (Impact)															
To be entered by the student	Frequency and accessibility of patterns that AI is trained on Unlikely: AI often repeats things it has seen many times during training. If a concept or phrase is common, the model might use it even when it doesn't fully fit your question, because it "sounds right". This is caused by the probabilistic (rather than exact) nature of AI. For very specialized, complex or advanced topics (patterns are rare or absent in training data), the AI has little or no prior examples. It will try to "fill the gap" by guessing based on related concepts, which often produces misleading outputs and you cannot refine them. Likely: Task covers highly specialized or advanced topics with rare patterns, where AI often struggles.	☒ Possible (2) ☐ Likely (3)	Example possible (Summarize lecture notes on thermodynamics) Reasoning: Thermodynamics is moderately specialized. AI has seen similar patterns but may misinterpret context or equations. This requires some interpretation, so there is a possible risk.	Clear, simple prompts; Complex prompts; Productive misleading outputs and you cannot refine them.	☐ Unlikely (1) ☒ Possible (2) ☐ Likely (3)	Alignment with learning objectives & future learning (essential knowledge & skills)	Minor: Task applies basic theories, equations, tools etc. and reinforces foundational knowledge. Not part of learning objective course. Task requires minimal practice; skipping has little impact on fluency.	☐ Minor (1)															
	Conflicting information in training data Unlikely: Topic has widely agreed principles with strong consensus. Possible: Topic shows minor discrepancies or moderate variation between sources. Likely: Topic involves multiple conflicting theories; if unsure, treat as high risk because AI may mix contradictions.	☒ Unlikely (1) ☐ Possible ☐ Likely (3)			Unlikely: Strong domain knowledge; errors are easily spotted. Knowledge gained in previous		☐ Unlikely (1) ☒ Possible (2) ☐ Likely (3)	Moderate: Task builds on core concepts for applied or moderately advanced projects, contributing to deeper understanding but not critical for mastery (partially learning objectives). Task benefits from some repetition to build confidence and speed, but gaps are manageable. Major: Task is essential for mastery or heavily weighted in grading/exams (core learning objective of course); skipping it creates knowledge gaps. Task needs repeated practice for fluency (e.g. calculations, coding, diagrams); skipping blocks automaticity and speed under pressure.	☒ Moderate (2) ☐ Major (3)														
	Outdated / incomplete / false data Unlikely: Task is based on stable, well-established knowledge. Possible: Task involves emerging but generally stable knowledge that may need occasional updates. Likely: Task covers recent, evolving, or error-prone topics, where reliability is uncertain.	☐ Unlikely (1) ☒ Possible ☐ Likely (3)						Minor: Using AI is fully allowed under course rules and university policy.	☐ Minor (1)														
	Bias in AI algorithms Unlikely: Task is simple and factual, requiring minimal interpretation. Possible: Task is contextual and explanatory, needing some reasoning or clarification. Unlikely: Task demands nuanced reasoning and detailed accuracy, where precision is critical.	☒ Unlikely (1) ☐ Possible (2) ☐ Likely (3)						Minor: Task applies basic theories, equations, tools etc. and reinforces foundational knowledge. Not part of learning objective course. Task requires minimal practice; skipping has little impact on fluency.	☐ Minor (1)

“RISKS” NOT USING AI

Reduced efficiency for “know-how-to-do” tasks

Missed opportunity to train essential skills to learn to work with AI

...

ASSIGNMENT FOR TODAY

Consider performing a literature review using AI:

- Searching good literature
- Reading
- Summarizing
- Structuring
- Writing literature review document
- ...

1. Choose 1 task you would like to perform with AI (not a Google search tasks), define properly
2. Apply the AI-RAP tool for this task
3. Use the outcome to select necessary verification method(s) for this task
4. Result of assignment can be used to demonstrate academic professionalism, see Canvas

ASSIGNMENT FOR TODAY

Download the AI-RAP tool

If check boxes do not work: enter the numbers
1-3 yourself and calculate the average
